Singular integrals on \mathbb{R}^n

If $T: L^2(\mathbb{R}^n) \to L^2(\mathbb{R}^n)$ is a convolution operator with kernel $k: \mathbb{R}^n \setminus \{0\} \to \mathbb{C}$ s.t.

$$\sup_{y \neq 0} \int_{|x| \ge 2|y|} |k(x-y) - k(x)| \, dx < \infty$$
,

then T is of weak type (1,1) and bounded on $L^p(\mathbb{R}^n)$, $p\in(1,\infty)$.

The key ingredient is the classical Calderón–Zygmund theory which relies on the doubling property, i.e.

 $V(2B) \leq C V(B)$ for every ball B.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Singular integrals on \mathbb{R}^n

TWO EXAMPLES:
$$\Delta = -\sum_{j=1}^{n} \partial_j^2 = \int_0^{\infty} \lambda \, dE(\lambda)$$

Riesz transforms

 $R_j = \partial_j \circ \Delta^{-1/2} \qquad R_j f = c_n f * p.v. \frac{x_j}{|x|^{n+1}}$

 R_j is of weak type (1,1) and bounded on $L^p(\mathbb{R}^n)$, $p\in(1,\infty)$

Spectral multipliers of Mihlin-Hörmander type

$$\begin{split} F: \mathbb{R}^+ &\to \mathbb{C} \text{ bounded} \\ F(\Delta) &= \int_0^\infty F(\lambda) \, \mathrm{d} E(\lambda) \qquad F(\Delta) f = f * \mathcal{F}^{-1} F(|\cdot|^2) \\ \mathrm{lf} \sup_{t>0} \|F(t\cdot)\phi(\cdot)\|_{W_2^s} < \infty \text{ for some } s > \frac{n}{2} \text{ and } 0 \neq \phi \in C_c^\infty(0,\infty), \\ \mathrm{then} \ F(\Delta) \text{ is of weak type } (1,1) \text{ and bounded on } L^p(\mathbb{R}^n), \ p \in (1,\infty) \end{split}$$

Singular integrals on \mathbb{R}^n

TWO EXAMPLES:
$$\Delta = -\sum_{j=1}^{n} \partial_j^2 = \int_0^{\infty} \lambda \, dE(\lambda)$$

Riesz transforms

 $R_j = \partial_j \circ \Delta^{-1/2} \qquad R_j f = c_n f * p.v. \frac{x_j}{|x|^{n+1}}$

 R_j is of weak type (1,1) and bounded on $L^p(\mathbb{R}^n)$, $p\in(1,\infty)$

Spectral multipliers of Mihlin-Hörmander type

$$\begin{split} F: \mathbb{R}^+ &\to \mathbb{C} \text{ bounded} \\ F(\Delta) &= \int_0^\infty F(\lambda) \, \mathrm{d} E(\lambda) \qquad F(\Delta) f = f * \mathcal{F}^{-1} F(|\cdot|^2) \\ \text{If } \sup_{t>0} \|F(t \cdot) \phi(\cdot)\|_{W_2^s} < \infty \text{ for some } s > \frac{n}{2} \text{ and } 0 \neq \phi \in C_c^\infty(0, \infty), \\ \text{then } F(\Delta) \text{ is of weak type } (1, 1) \text{ and bounded on } L^p(\mathbb{R}^n), \ p \in (1, \infty) \\ (\text{Ex.:} \quad F \in C^\infty(\mathbb{R}^+) \quad \text{s.t.} \quad |D^k F(\lambda)| \leq C_k \, \lambda^{-k} \quad \forall \lambda > 0, k \in \mathbb{N}) \end{split}$$

Singular integrals on Lie groups

G connected noncompact Lie group

 μ right Haar measure

 X_0, \ldots, X_q left-invariant vector fields satisfying Hörmander's condition $\Delta = -\sum_{j=0}^q X_j^2$ (sub)Laplacian s.a. on $L^2(G) = L^2(G, \mu)$ hypoelliptic and positive

QUESTIONS:

- boundedness of Riesz transforms $R_j = X_j \Delta^{-1/2}$
- ▶ boundedness of spectral multipliers of Δ , i.e. find conditions on

 $F: \mathbb{R}^+ \to \mathbb{C}$ bounded s.t.

 $F(\Delta) = \int_0^{+\infty} F(\lambda) dE(\lambda)$ is bounded on $L^p(G)$ for some $p \neq 2$

► G Lie group of polynomial growth

▶ R_j is of weak type (1, 1) and bounded on $L^p(G)$, $p \in (1, \infty)$ [Christ-Geller (1984), Lohoué-Varopoulos (1985), Alexopoulos (1992)]

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

 a Mihlin-Hörmander type theorem holds [Mauceri-Meda (1990), Christ (1991), Alexopoulos (1994),...]

In these cases G is unimodular and G is a doubling measured space

 \Rightarrow the classical CZ theory applies

► G Lie group of polynomial growth

- ▶ R_j is of weak type (1, 1) and bounded on $L^p(G)$, $p \in (1, \infty)$ [Christ-Geller (1984), Lohoué-Varopoulos (1985), Alexopoulos (1992)]
- a Mihlin-Hörmander type theorem holds [Mauceri-Meda (1990), Christ (1991), Alexopoulos (1994),...]

In these cases G is unimodular and G is a doubling measured space \Rightarrow the classical CZ theory applies

• $G = \mathbb{R}^{n-1} \rtimes \mathbb{R} \simeq \mathbb{H}^n(\mathbb{R})$

 X_0, \ldots, X_{n-1} basis of $\mathfrak{g} = Lie(G)$ $\Delta = -\sum_{j=0}^{n-1} X_j^2$ complete Laplacian

G is a nonunimodular group of exponential growth \Rightarrow *G* is nondoubling \Rightarrow Hebisch and Steger (2003) developed a new CZ theory to prove that

- ▶ R_j is of weak type (1, 1) and bounded on $L^p(G)$, $p \in (1, 2]$ (see also Sjögren (1999))
- a Mihlin-Hörmander type theorem holds (see also Hebisch (1993), Cowling-Giulini-Hulanicki-Mauceri (1994))

NA groups

 $G = N \rtimes A$

► N stratified group

 $\begin{array}{l} \text{Lie}(N) = \mathfrak{n} = V_1 \oplus \cdots \oplus V_s \quad [V_i, V_j] \subseteq V_{i+j} \quad (V_k = 0 \text{ if } k > s) \\ \delta_t \in \text{Aut}(\mathfrak{n}) \text{ automorphic dilations s.t. } \delta_t |_{V_j} = t^j Id_{V_j} \quad \forall t > 0 \\ \det \delta_t = t^Q \qquad Q = \sum_{j=1}^s j \dim V_j \text{ homogeneous dimension of } N \end{array}$

• $A = \mathbb{R}$ acting on N via automorphic dilations

$$\begin{aligned} &(z, u) \cdot (z', u') = (z \cdot \delta_{e^u} z', u + u') & \forall z, z' \in N, u, u' \in \mathbb{R} \\ &d\mu(z, u) = dz \, du & \text{right Haar measure} \\ &m(z, u) = e^{-Qu} \text{ modular function} \end{aligned}$$

$$\begin{split} E_0 &= \partial_u \text{ basis of } \mathfrak{a} \simeq \mathbb{R} \qquad E_1, \dots, E_q \text{ basis of the first layer } V_1 \text{ of } \mathfrak{n} \\ X_0 &= \partial_u \qquad X_j = e^u E_j \quad j = 1, \dots, q \quad \text{left invariant v.f. on } G \\ \Delta &= -\sum_{j=0}^q X_j^2 \text{ subLaplacian} \end{split}$$

 $G=N\rtimes A$

- N stratified group of homogeneous dimension Q
- $A = \mathbb{R}$ acting on N via automorphic dilations

THEOREM 1. [Martini-Ottazzi-V.]

 $R_j = X_j \Delta^{-1/2}$ is of weak type (1,1) and bounded on $L^p(G)$, $p \in (1,2]$.

THEOREM 2. [Martini-Ottazzi-V.] If $F : \mathbb{R}^+ \to \mathbb{C}$ bounded s.t.

$$\begin{split} \sup_{0 < t \le 1} \|F(t \cdot)\phi(\cdot)\|_{W_2^{s_0}} &< \infty \qquad s_0 > \frac{3}{2} \\ \sup_{t \ge 1} \|F(t \cdot)\phi(\cdot)\|_{W_2^{s_\infty}} &< \infty \qquad s_\infty > \frac{Q+1}{2} \end{split}$$

then $F(\Delta)$ is of weak type (1,1) and bounded on $L^{p}(G)$, $p \in (1,\infty)$.

THEOREM 1. [Martini-Ottazzi-V.]

 $R_j = X_j \Delta^{-1/2}$ is of weak type (1, 1) and bounded on $L^p(G)$, $p \in (1, 2]$. THEOREM 2. [Martini-Ottazzi-V.] If $F : \mathbb{R}^+ \to \mathbb{C}$ bounded s.t.

$$\begin{split} \sup_{0 < t \leq 1} \left\| \mathsf{F}(t \cdot) \phi(\cdot) \right\|_{W_2^{s_0}} < \infty \qquad s_0 > \frac{3}{2} \\ \sup_{t \geq 1} \left\| \mathsf{F}(t \cdot) \phi(\cdot) \right\|_{W_2^{s_\infty}} < \infty \qquad s_\infty > \frac{Q+1}{2} \,, \end{split}$$

then $F(\Delta)$ is of weak type (1,1) and bounded on $L^p(G)$, $p \in (1,\infty)$.

REMARKS:

- ▶ when N is abelian, $G = N \rtimes A \simeq \mathbb{H}^n(\mathbb{R})$, Δ is a complete Laplacian related with the hyperbolic Laplacian: THEOREMS 1 and 2 were proved by Hebisch and Steger using spherical harmonic analysis and explicit formulae for the heat kernel
- ▶ if $F \in C_c(\mathbb{R}) \cap W_2^s(\mathbb{R})$ with s > 2, then $F(\Delta)$ is bounded on $L^1(G)$ [Mustapha (1998), Gnewuch (2002)]

THEOREM 1. [Martini-Ottazzi-V.]

 $R_j = X_j \Delta^{-1/2}$ is of weak type (1, 1) and bounded on $L^p(G)$, $p \in (1, 2]$. THEOREM 2. [Martini-Ottazzi-V.] If $F : \mathbb{R}^+ \to \mathbb{C}$ bounded s.t.

$$\begin{split} \sup_{0 < t \leq 1} \left\| \mathsf{F}(t \cdot) \phi(\cdot) \right\|_{W_2^{\mathfrak{s}_0}} < \infty \qquad s_0 > \frac{3}{2} \\ \sup_{t \geq 1} \left\| \mathsf{F}(t \cdot) \phi(\cdot) \right\|_{W_2^{\mathfrak{s}_\infty}} < \infty \qquad s_\infty > \frac{Q+1}{2} \,, \end{split}$$

then $F(\Delta)$ is of weak type (1,1) and bounded on $L^p(G)$, $p \in (1,\infty)$.

REMARKS:

- ▶ when *N* is abelian, $G = N \rtimes A \simeq \mathbb{H}^n(\mathbb{R})$, Δ is a complete Laplacian related with the hyperbolic Laplacian: THEOREMS 1 and 2 were proved by Hebisch and Steger using harmonic spherical analysis and explicit formulae for the heat kernel
- if $F \in C_c(\mathbb{R}) \cap W_2^s(\mathbb{R})$ with s > 2, then $F(\Delta)$ is bounded on $L^1(G)$ [Mustapha (1998), Gnewuch (2002)]
- boundedness of R_j for p > 2?

► X₀,..., X_q defines a sub-Riemannian structure on G with associated left-invariant Carnot-Carathéodory distance *Q*

 $\cosh |x|_{\varrho} = \cosh arrho ig(x, e_Gig) = \cosh u + e^u |z|_N^2/2 \qquad orall x = (z, u) \in N
times A$,

where $|\cdot|_N$ is the Carnot-Carathéodory distance on N

- formula known when N is abelian and stated without proof for stratified N by Hebisch (1999)
- solutions to Hamilton's equations on N can be re-parametrized and lifted to solutions to Hamilton's equations on G
- length-minimizing curves need not be solutions to to Hamilton's equations. But points that can be joined to the identity via length-minimizing solution to Hamilton's equations are dense [Agrachev (2009)]

$$\blacktriangleright \ \mu(B_{\varrho}(e_{G},r)) \lesssim \begin{cases} r^{Q+1} & r \leq 1 \\ e^{Qr} & r > 1 \end{cases} \Rightarrow (G,\varrho,\mu) \text{ is nondoubling}$$

We develop a Calderón–Zygmund theory on the nondoubling subRiemannian space (G, ϱ, μ)

Boundedness result for convolution operators on G

T right convolution operator bounded on $L^2(G)$, i.e., Tf = f * k \Rightarrow the integral kernel of T is $K(x, y) = k(y^{-1}x)m(y)$

If $k = \sum_{n \in \mathbb{Z}} k^n$ with

$$\begin{aligned} (i) & \int_{G} |k^{n}(x)| \left(1 + 2^{-n/2} |x|_{\ell}\right) d\mu(x) \lesssim 1 \\ (ii) & \int_{G} |k^{n}(y^{-1}x)m(y) - k^{n}(x)| d\mu(x) \lesssim 2^{-n/2} |y|_{\ell} \quad \forall y \in G \,, \end{aligned}$$

then T is of weak type (1,1) and bounded on $L^p(G)$, $p \in (1,2]$.

Boundedness result for convolution operators on G

T right convolution operator bounded on $L^2(G)$, i.e., Tf = f * k \Rightarrow the integral kernel of T is $K(x, y) = k(y^{-1}x)m(y)$

If $k = \sum_{n \in \mathbb{Z}} k^n$ with

$$\begin{aligned} (i) & \int_{G} |k^{n}(x)| \left(1 + 2^{-n/2} |x|_{\ell}\right) d\mu(x) \lesssim 1 \\ (ii) & \int_{G} |K^{n}(x, y) - K^{n}(x, e_{G})| d\mu(x) \lesssim 2^{-n/2} |y|_{\ell} \quad \forall y \in G \,, \end{aligned}$$

then T is of weak type (1,1) and bounded on $L^{p}(G)$, $p \in (1,2]$.

• Gradient estimates of the heat kernel h_t of Δ

LEMMA. For every t > 0

 $\int_{G} |X_{j}h_{t}(x)| \, \mathrm{d}\mu(x) \leq C \, t^{-1/2} \, .$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

• Gradient estimates of the heat kernel h_t of Δ

LEMMA. For every t > 0

$$\int_{G} |X_{j}h_{t}(x)| \, \mathrm{d}\mu(x) \leq C \, t^{-1/2} \, .$$

It follows from the formula [Mustapha 1998, Gnewuch 2006]

$$h_t(z, u) = \int_0^\infty \Psi_t(\xi) \exp\left(-\frac{\cosh u}{\xi}\right) h_{e^u\xi/2}^N(z) d\xi,$$

where

$$\Psi_t(\xi) = \frac{\xi^{-2}}{\sqrt{4\pi^3 t}} \exp\left(\frac{\pi^2}{4t}\right) \int_0^\infty \sinh\theta \, \sin\frac{\pi\theta}{2t} \, \exp\left(-\frac{\theta^2}{4t} - \frac{\cosh\theta}{\xi}\right) \mathrm{d}\theta \,,$$

estimates for the derivative of the heat kernel on N and various integration by parts (delicate cancellation occurs)

• Gradient estimates of the heat kernel h_t of Δ

LEMMA. For every $\varepsilon \geq 0$ and t > 0

$$\int_{\mathcal{G}} |X_j h_t(x)| \exp(\varepsilon t^{-1/2} |x|_{\varrho}) \, \mathrm{d} \mu(x) \lesssim C_{\varepsilon} \, t^{-1/2} \, .$$

It follows from the formula [Mustapha 1998, Gnewuch 2006]

$$h_t(z, u) = \int_0^\infty \Psi_t(\xi) \exp\left(-\frac{\cosh u}{\xi}\right) h_{e^u\xi/2}^N(z) d\xi,$$

where

$$\Psi_t(\xi) = \frac{\xi^{-2}}{\sqrt{4\pi^3 t}} \exp\left(\frac{\pi^2}{4t}\right) \int_0^\infty \sinh\theta \, \sin\frac{\pi\theta}{2t} \, \exp\left(-\frac{\theta^2}{4t} - \frac{\cosh\theta}{\xi}\right) \mathrm{d}\theta \,,$$

estimates for the derivative of the heat kernel on N and various integration by parts (delicate cancellation occurs)

more general NA groups

$$F(\Delta) = \sum_{n \in \mathbb{Z}} F(\Delta) \phi(2^{-n}\Delta) = \sum_{n \in \mathbb{Z}} F_n(2^{-n}\Delta)$$
$$\phi \in C_c^{\infty}(\mathbb{R}^+), \sum_n \phi(2^n\lambda) = 0, \operatorname{supp}(\phi) \subset [1/4, 4]$$

The kernel k^n of $F_n(2^{-n}\Delta)$ satisfy the conditions of the boundedness theorem. This follows from various facts:

• Δ and $\tilde{\Delta}$ on $\tilde{G} = \mathbb{R}^Q \rtimes \mathbb{R}$ have the same Plancherel measure, i.e.

$$\int_{G} |k_{F(\Delta)}(z, u)|^{2} \mathrm{d}z \mathrm{d}u = \int_{0}^{\infty} |F(\lambda)|^{2} |\mathbf{c}_{\mathbf{Q}}(\lambda)|^{-2} \mathrm{d}\lambda \sim \int_{0}^{\infty} |F(\lambda)|^{2} (\lambda^{2} + \lambda^{Q}) \mathrm{d}\lambda$$

 $\mathbf{c}_{\mathbf{Q}}$ Harish-Chandra function on $\mathbb{H}^{Q+1}(\mathbb{R})$

▶ weighted L²-estimates on G for k_{F(∆)} can be reduced to weighted L²-estimates for k_{F(∆)} on G̃

$$\int_{G} |k_{F(\Delta)}(z,u)|^{2} |z|_{N}^{2a} \mathrm{d}z \mathrm{d}u \leq \int_{\tilde{G}} |k_{F(\tilde{\Delta})}(z,u)|^{2} |z|_{\mathbb{R}^{Q}}^{2a} \mathrm{d}z \mathrm{d}u,$$

where $\tilde{m}^{-1/2}k_{F(\tilde{\Delta})}(z, u)$ is radial (and one can use spherical analysis on \tilde{G})

$$F(\Delta) = \sum_{n \in \mathbb{Z}} F(\Delta) \phi(2^{-n}\Delta) = \sum_{n \in \mathbb{Z}} F_n(2^{-n}\Delta)$$
$$\phi \in C_c^{\infty}(\mathbb{R}^+), \sum_n \phi(2^n\lambda) = 1, \operatorname{supp}(\phi) \subset [1/4, 4]$$

The kernel k^n of $F_n(2^{-n}\Delta)$ satisfy the conditions of the boundedness theorem. This follows from various facts:

- Δ and $\tilde{\Delta}$ on $\tilde{G} = \mathbb{R}^Q \rtimes \mathbb{R}$ have the same Plancherel measure
- ▶ weighted L²-estimates on G for k_{F(∆)} can be reduced to weighted L²-estimates for k_{F(∆)} on G̃
- if the Fourier transform of M is supported in [-R, R], then

$$||k_{\mathcal{M}(\Delta)}||_1 \lesssim \min\{R^{3/2}, R^{(Q+1)/2}\} ||k_{\mathcal{M}(\Delta)}||_2$$

► F_n(2⁻ⁿ·) can be decomposed as the sum of functions whose Fourier transform is compactly supported in order to apply previous estimate

$$F(\Delta) = \sum_{n \in \mathbb{Z}} F(\Delta) \phi(2^{-n}\Delta) = \sum_{n \in \mathbb{Z}} F_n(2^{-n}\Delta)$$
$$\phi \in C_c^{\infty}(\mathbb{R}^+), \sum_n \phi(2^n\lambda) = 1, \operatorname{supp}(\phi) \subset [1/4, 4]$$

The kernel k^n of $F_n(2^{-n}\Delta)$ satisfy the conditions of the boundedness theorem $\Rightarrow F(\Delta)$ is of weak type (1, 1) and bounded on $L^p(G)$, $p \in (1, \infty)$
