

# Relations (Mathematics & Logic A)

RWK/MRQ

December 6, 2002

**Note.** The concepts in this lecture are quite abstract. It is *very important* that you attempt to learn them and ensure you can distinguish between them (even when they might appear to have similar names).

## 1 Relations and Functions

**Definition 1.** A *relation* on a set  $A$  is a collection of one-way links between certain pairs of elements of  $A$ .

**Definition 2 (Formal Version).** A *relation* on a set  $A$  is a subset of  $A \times A$ .

The correspondence between these two definitions is as follows: If we have a collection of one-way links (drawn with arrows, say  $x \rightarrow y$ ), then the corresponding ordered pairs are given by the end-points of the links. So if we have a link from  $x$  to  $y$ , we record the ordered pair  $(x, y)$  in the subset  $R$ .

Conversely, if we have a subset  $R$  of  $A \times A$ , then for each ordered pair  $(x, y)$  in  $R$  we draw an arrow from  $x$  to  $y$ .

If  $R$  is a relation on a set  $A$ , we write  $xRy$  to indicate that  $x$  and  $y$  are related under  $R$ . (Thus  $xRy$  means that the ordered pair  $(x, y)$  belongs to the corresponding subset of  $A \times A$ ; that is, there is a link from  $x$  to  $y$  in the sense of the first definition.)

**Definition 3.** Let  $R$  be a relation on a set  $A$ .

- i.  $R$  is *symmetric* if whenever  $xRy$  holds, then also  $yRx$  holds.
- ii.  $R$  is *transitive* if whenever  $xRy$  and  $yRz$  hold, then also  $xRz$  holds.
- iii.  $R$  is *reflexive* if for all  $x \in A$ ,  $xRx$  holds.

**Definition 4.** An *equivalence relation* on a set  $A$  is a relation  $R$  which is symmetric, transitive and reflexive.

**Definition 5.** Let  $A$  be a set and  $R$  be an equivalence relation on  $A$ . If  $x \in A$ , the *equivalence class* of  $x$  is the subset

$$[x] = \{ y \in A : xRy \}$$

So the equivalence class of  $x$  contains all elements  $y$  which are related to  $x$  under  $R$ .

**Lemma 6.** Let  $R$  be an equivalence relation on the set  $A$  and let  $x \in A$ . If  $x' \in [x]$ , then  $[x'] = [x]$ .

*Proof.* Since we wish to prove that two sets are equal, we follow the usual method of showing all the elements of one set lie in the other and vice versa.

Note first our starting hypothesis is that we have an element  $x'$  in the equivalence class of  $x$ . This means that our  $x'$  satisfies  $xRx'$ .

**Step 1:** Let  $y \in [x']$ . This means that  $x'Ry$ . We then have two instances of elements being related under  $R$ : both  $xRx'$  and  $x'Ry$  hold. Since  $R$  is transitive, this implies that  $xRy$ . Hence  $y \in [x]$ .

We have shown that if  $y \in [x']$ , then  $y \in [x]$ . This means  $[x'] \subseteq [x]$ .

**Step 2:** Let  $y \in [x]$ . This means that  $xRy$  holds. Now we know that  $xRx'$  holds (since this is our original assumption on  $x'$ ). Since  $R$  is symmetric, this implies that  $x'Rx$  holds. We now have both  $x'Rx$  and  $xRy$  holding, so we deduce that  $x'Ry$  holds (as  $R$  is transitive). This means that  $y \in [x']$ .

We have shown that if  $y \in [x]$ , then  $y \in [x']$ . This means  $[x] \subseteq [x']$ .

Finally, if we put Steps 1 and 2 together, we obtain  $[x'] = [x]$ , as required.
